

How to apply Plantos Verde

Application: Fine-mist spray the green parts of the plants in the morning and evening hours.

Dosage: 0,2-0,3% depending on the climate, vegetable crop and treatment, often depending on the stage of plant development. Basically 0,3% (3g/ 1 liter of water) every 10-21 days, or 3 kg/ 1000 liters per 1-2 ha for treatment.

Number of treatments: every 10-21 days (14 days in average), as soon as the plant has a minimum of 3 leaves, 3-4 times during the growing season.

Orchards, vineyards and horticulture: every 10-21 days.

Olive groves: 6 -7 times per year.

Crops: 3-4 times during the growing season.

Lawns and playgrounds: starting in May and then every 10-14 days during the summer.

Forests and parks (ornamental): after leafing for 10-21 days.

Garden: about 1 heaped teaspoon, approximately 5 grams per liter of water filled into a usual garden sprayer. The solution is application-ready after stirring for 5-6 hours, then stir again if necessary.

It is important to spray Plantos Verde in the form of a fine fog, so that it can easily penetrate the leaf. The best time for spraying is morning, at temperatures ranging between 8 and 20°C, and hygrometry > 60%.

The following formula gives the calculation of the nozzle outflow:

$$O = (Q \times L \times V) / 600$$

O = outflow

L = active width of the nozzle

V = speed Nozzle size: ranges from 150µm to 300µm, under the pressure of 3 to 4 bar.

Spraying

Spraying with Plantos Verde starts with the dilution of powder in a smaller amount of water so that the Plantos Verde powder can dissolve as evenly as possible.

Dissolved in a small amount of water, Plantos Verde is poured into the container with the measured amount of water, resulting in a solution for spraying containing 0.3% of Plantos Verde.

Spraying can be done with any type of the usual spray and misting equipment.
